Im Buch ist die Entwicklung der Emissionen aus der Verbrennung von Biokraftstoffen über einen Zeitraum von 15 Jahren beschrieben. Dazu wurden am Thünen-Institut für Agrartechnologie in Braunschweig limitierte und nicht limitierte Emissionen an sechs verschiedenen Dieselmotoren bestimmt, die in verschiedenen Abgasklassen bis Euro IV eingestuft waren. Dabei wurden hauptsächlich Motoren untersucht, die in Nutzfahrzeugen oder in landwirtschaftlichen Maschinen Verwendung finden. Als prominentester biogener Kraftstoff wurde Biodiesel aus Raps mit fossilem Dieselmotorkraftstoff bei allen Versuchsreihen verglichen. Daneben wurden reines Pflanzenöl, hydriertes Pflanzenöl und Fischer-Tropsch-Kraftstoffe sowohl in Reinkraftstoffform als auch in Mischung mit Dieselmotorkraftstoff untersucht. Im Laufe der Jahre musste die Analysetechnik kontinuierlich an die immer sauberen Verbrennungsabgase angepasst werden. Probenahme und Messtechnik sind beispielhaft in dieser Arbeit beschrieben.
