An example of an exothermic reaction is the mixture of sodium and chlorine to yield table salt. This reaction produces 411 kJ of energy for each mole of salt that is produced:  $\text{Na(s)} + 0.5\text{Cl}_2\text{(s)} = \text{NaCl(s)}$

Results, Discussion and Conclusion and space is provided for students to answer questions and fill out the results table.

## **Exothermic and Endothermic Reactions experiment | Teaching ...**

Exothermic reactions release lots of energy in the form of heat when they react

# Where To Download Exothermic Experiment

whereas endothermic reactions absorb heat and therefore drop in temperature when reacting. This practical contains four separate reactions where students predict and then record whether the reactions are exothermic or endothermic by using a thermometer or datalogger to record the temperature of the mixtures.
